#> # i 228 more rows
#> # i 1 more variable: class <chr>
```

- displ: A car's engine size, in liters. A numerical variable.
- hwy: A car's fuel efficiency on the highway, in miles per gallon (mpg). A car
 with a low fuel efficiency consumes more fuel than a car with a high fuel
 efficiency when they travel the same distance. A numerical variable.
- class: Type of car. A categorical variable.

Groups can go unplotted

ggplot(mpg, aes(x = displ, y = hwy, color = class)) +

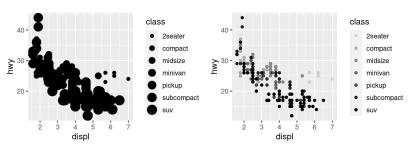

Left

geom_point()

```
# Right
ggplot(mpg, aes(x = displ, y = hwy, shape = class)) +
  geom_point()
#> Warning: The shape palette can deal with a maximum of 6 discrete values
#> because more than 6 becomes difficult to discriminate; you have 7.
#> Consider specifying shapes manually if you must have them.
#> Warning: Removed 62 rows containing missing values ('geom_point()').

```

not advised

Left ggplot(mpg, aes(x = displ, y = hwy, size = class)) + geom_point() #> Warning: Using size for a discrete variable is not advised. # Right ggplot(mpg, aes(x = displ, y = hwy, alpha = class)) + geom_point() #> Warning: Using alpha for a discrete variable is not advised.

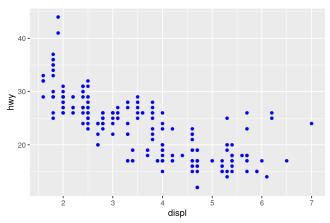

Implies an order that does not exist.

ggplot2 defaults

- It selects a reasonable scale to use with the aesthetic.
- It constructs a legend that explains the mapping between levels and values.
- For x and y aesthetics, ggplot2 does not create a legend.
- But it creates an axis line with tick marks and a label.
- The axis line provides the same information as a legend.
- It explains the mapping between locations and values.

Set visual properties manually

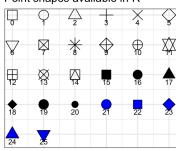

```
ggplot(mpg, aes(x = displ, y = hwy)) +
  geom_point(color = "blue")
```

Properties of points

- Color as character string, e.g. color = "blue"
- Size in mm, e.g. size = 1
- Shape as integer, e.g. shape = 1

Point shapes available in R

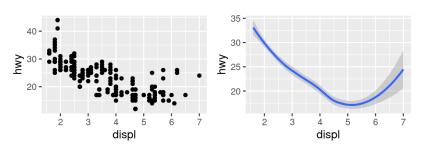

- R has 25 built-in shapes that are identified by numbers.
- There are some seeming duplicates: for example, 0, 15, and 22 are all squares.
- The difference comes from the interaction of the color and fill aesthetics.
- The hollow shapes (0-14) have a border determined by color
- The solid shapes (15-20) are filled with color
- The filled shapes (21-24) have a border of color and are filled with fill.

https://ggplot2.tidyverse.org/articles/ggplot2-specs.html

Do exercise 8

How are these plots similar?

```
# Left
ggplot(mpg, aes(x = displ, y = hwy)) +
    geom_point()

# Right
ggplot(mpg, aes(x = displ, y = hwy)) +
    geom_smooth()
#> 'geom_smooth()' using method = 'loess' and formula = 'y ~ x'
```

Mapping arguments

- Every geom function in ggplot2 takes a mapping argument.
- It is either defined locally in the geom layer or globally in the ggplot() layer.
- Not every aesthetic works with every geom.
- You could set the shape of a point, but you couldn't set the "shape" of a line.
- If you try, ggplot2 will silently ignore that aesthetic mapping.
- On the other hand, you could set the linetype of a line.
- geom_smooth() will draw a different line, with a different linetype, for each unique value of the variable that you map to linetype.

Mapping arguments

```
# Left
ggplot(mpg, aes(x = displ, y = hwy, shape = drv)) +
  geom_smooth()
# Right
ggplot(mpg, aes(x = displ, y = hwy, linetype = drv)) +
  geom_smooth()
   35 -
                                                         drv
   30 -
                                  30 -
À 25 -
                                À 25 -
  20 -
                                  20 -
   15 -
                                  15 -
```

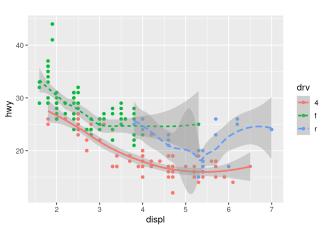

3

4 5 displ 3

displ

Mapping arguments

```
ggplot(mpg, aes(x = displ, y = hwy, color = drv)) +
  geom_point() +
  geom_smooth(aes(linetype = drv))
```

group aesthetic

- Many geoms, like geom_smooth(), use a single geometric object to display multiple rows of data.
- For these geoms, you can set the group aesthetic to a categorical variable to draw multiple objects.
- ggplot2 will draw a separate object for each unique value of the grouping variable.
- In practice, ggplot2 will automatically group the data for these geoms whenever you map an aesthetic to a discrete variable (as in the linetype example).
- It is convenient to rely on this feature because the group aesthetic by itself does not add a legend or distinguishing features to the geoms.

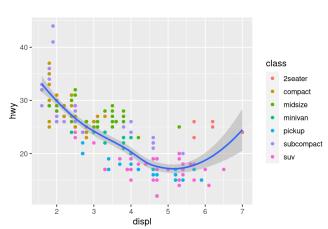

group aesthetic

Left

```
ggplot(mpg, aes(x = displ, y = hwy)) +
  geom_smooth()
# Middle
ggplot(mpg, aes(x = displ, y = hwy)) +
  geom_smooth(aes(group = drv))
# Right
ggplot(mpg, aes(x = displ, y = hwy)) +
  geom_smooth(aes(color = drv), show.legend = FALSE)

                                                                                30
                                                                                       40
    10
                hwy
                                                hwy
                                                                             hwy
```

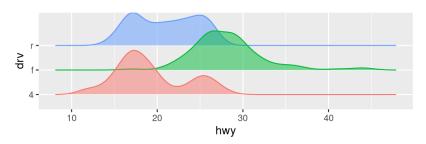

Extension packages

- ggplot2 provides more than 40 geoms.
- But these don't cover all possible plots one could make.
- If you need a different geom, we recommend looking into extension packages first to see if someone else has already implemented it.
- https://exts.ggplot2.tidyverse.org/gallery/
- For example, the ggridges package https://wilkelab.org/ggridges is useful for making ridgeline plots, which can be useful for visualizing the density of a numerical variable for different levels of a categorical variable.

Ridges example

```
library(ggridges)
```

```
ggplot(mpg, aes(x = hwy, y = drv, fill = drv, color = drv)) +
  geom_density_ridges(alpha = 0.5, show.legend = FALSE)
#> Picking joint bandwidth of 1.28
```

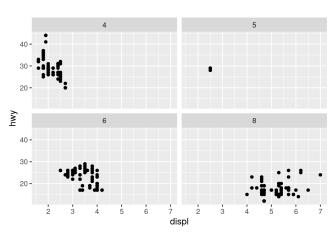

The tidyverse reference

https://ggplot2.tidyverse.org/reference

Do exercise 9

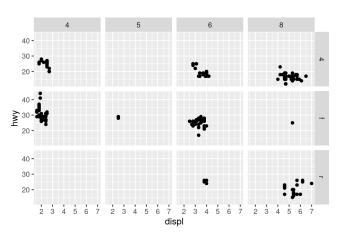

facet_wrap

```
ggplot(mpg, aes(x = displ, y = hwy)) +
  geom_point() +
  facet_wrap(~cyl)
```

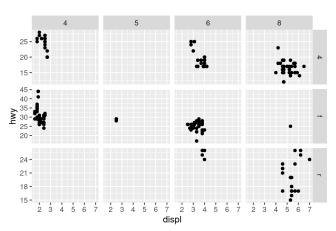

facet_grid

```
ggplot(mpg, aes(x = displ, y = hwy)) +
  geom_point() +
  facet_grid(drv ~ cyl)
```

Free the scales!

```
ggplot(mpg, aes(x = displ, y = hwy)) +
  geom_point() +
  facet_grid(drv ~ cyl, scales = "free_y")
```

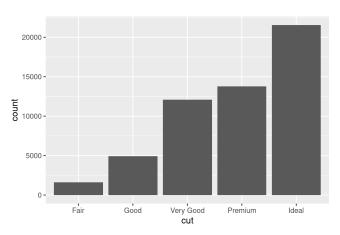

Do exercise 10

diamonds dataset

- The diamonds dataset is in the ggplot2 package.
- It contains information on $\approx 54,000$ diamonds.
- It includes carat, color, clarity, and cut of each diamond.

Bar chart

ggplot(diamonds, aes(x = cut)) +
 geom_bar()

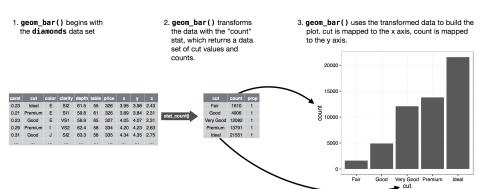

count is not in the dataset!

Statistical transformations

- Many graphs, like scatterplots, plot the raw values of your dataset.
- Other graphs, like bar charts, calculate new values to plot:
 - Bar charts, histograms, and frequency polygons bin your data and then plot bin counts, the number of points that fall in each bin.
 - Smoothers fit a model to your data and then plot predictions from the model.
 - Boxplots compute the five-number summary of the distribution and then display that summary as a specially formatted box.
- The algorithm used to calculate new values for a graph is called a **stat**, short for statistical transformation.

Computing stats

Stats

- You can learn which stat a geom uses by inspecting the default value for the stat argument.
- For example, ?geom_bar shows that the default value for stat is "count", which means that geom_bar() uses stat_count().
- stat_count() is documented on the same page as geom_bar().
- If you scroll down, the section called "Computed variables" explains that it computes two new variables: count and prop.

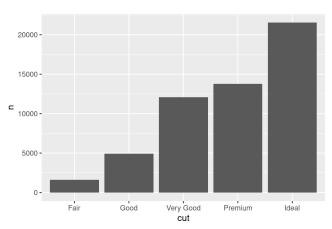

Stats

- Every geom has a default stat; and every stat has a default geom.
- This means that you can typically use geoms without worrying about the underlying statistical transformation.
- However, there are reasons why you might need to use a stat explicitly.

We might already have the value computed

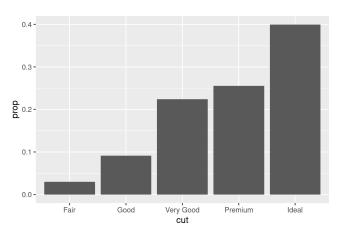

We might already have the value computed

```
diamonds |>
  count(cut) |>
  ggplot(aes(x = cut, y = n)) +
  geom_bar(stat = "identity")
```

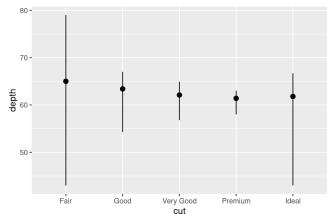

We might want to show proportion instead of count

ggplot(diamonds, aes(x = cut, y = after_stat(prop), group = 1)) +
 geom_bar()

We might want to use stat_summary

```
ggplot(diamonds) +
  stat_summary(
   aes(x = cut, y = depth),
  fun.min = min,
  fun.max = max,
  fun = median
)
```

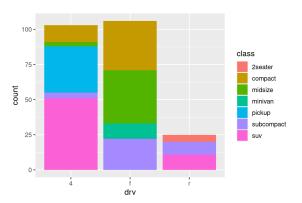

Do exercise 11

Bar charts can use either color or fill

```
# Left
ggplot(mpg, aes(x = drv, color = drv)) +
  geom_bar()
# Right
ggplot(mpg, aes(x = drv, fill = drv)) +
  geom_bar()
   100 -
                                                100 -
    75 -
                                       drv
                                                 75 -
                                                                                     drv
count
                                              count
    50 -
                                                 50 -
    25 -
                                                 25 -
    0 -
                    drv
                                                                 drv
```

Map fill to another variable

```
ggplot(mpg, aes(x = drv, fill = class)) +
  geom_bar()
```

- The stacking is performed automatically using the position adjustment specified by the position argument.
- Can be "identity", "dodge", or "fill".

identity not useful for bars

```
# Left
ggplot(mpg, aes(x = drv, fill = class)) +
  geom_bar(alpha = 1/5, position = "identity")
# Right
ggplot(mpg, aes(x = drv, color = class)) +

drv

position = jitter useful for scatterplots

```
ggplot(mpg, aes(x = displ, y = hwy)) +
  geom_point(position = "jitter")
```

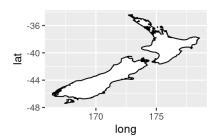

geom_jitter() is shorthand for geom_point(position = "jitter")

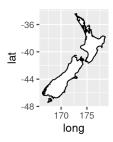

Do exercise 12

coord_quickmap

```
nz <- map_data("nz")
ggplot(nz, aes(x = long, y = lat, group = group)) +
  geom_polygon(fill = "white", color = "black")
ggplot(nz, aes(x = long, y = lat, group = group)) +
  geom_polygon(fill = "white", color = "black") +
  coord_quickmap()</pre>
```

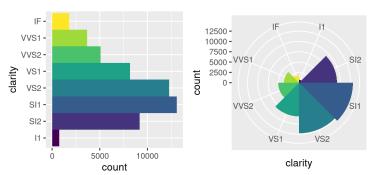

https://ggplot2-book.org/maps.html

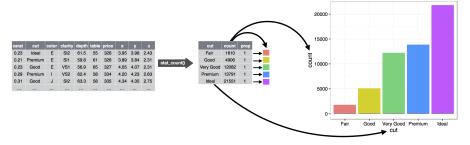

Polar coordinates

```
bar <- ggplot(data = diamonds) +
  geom_bar(
    mapping = aes(x = clarity, fill = clarity),
    show.legend = FALSE,
    width = 1
  ) +
  theme(aspect.ratio = 1)
bar + coord_flip()
bar + coord_polar()</pre>
```

ggplot2 template

- Any graph can be made with these seven parameters.
